#### Inverse square law violating forces

Predicted by String theory and other brane theoretical models that attempt unification of all the fundamental forces

• One such model is Randall-Sundrum(RS) brane-world model,

$$U_{\text{RS}}(z) \approx \frac{GM}{z} \left(1 + \frac{l_{\text{s}}^2}{z^2}\right)$$

• Super-symetric extensions  $\rightarrow$  new forces in sub-mm regime Paramaterization of deviations from inverse square law

$$\mathbf{U}_{\mathbf{Yuk}}(\mathbf{z}) pprox rac{\mathbf{GM}}{\mathbf{z}} \left(\mathbf{1} + lpha \mathbf{e}^{rac{-\mathbf{z}}{\lambda}}
ight)$$

#### Constraints on the violation parameters

# What is Casmir force

The Casimir Force between parallel metal plates at zero temperature

$$F_c(z) = -\frac{\pi^2 \hbar c}{240 z^4}.$$
  
=  $-\frac{0.013}{z_{\mu}^4}$  dyn. cm<sup>-2</sup>  
where  $z_{\mu} \equiv z$  in microns

At any finite temperature the force is given by,

$$F_c^T(z) = -\frac{k_B T}{4\pi z^3} \sum_{n=0}^{n'} \int_{nx}^{\infty} \frac{dy y^2}{e^y - 1} \text{ where } x \equiv 4\pi k_B T z / \hbar c$$
$$F_c^T(z) \simeq -\frac{\zeta(3) k_B T}{4\pi z^3} \text{ at high } T \text{ (i.e. } x \gg 1)$$
$$\text{with } \zeta(3) = 1.20206$$

# Casimir force vs Temperature

The Casimir force at various ambient temperatures for plates of about 2cm radius

#### Past measurements of Casimir Force

Data from measurements of Casimir force

# GWI as force transducer

Scheme to measure force

#### Forces acting on the suspension Gravitational force between parallel plates

$$\mathsf{F}_{\mathsf{grav}}(\mathsf{z}) pprox \mathbf{2} \pi^2 \mathsf{r}^2 \mathbf{G} 
ho_1 
ho_2 \mathsf{T} \mathsf{t}$$

Yukawa type interaction

$$\mathbf{F}_{\mathsf{yuk}}(\mathbf{z}) = \mathbf{2}\pi^{2}\mathbf{r}^{2}\mathbf{G}\alpha\lambda^{2}\mathbf{e}^{\frac{-\mathbf{z}}{\lambda}}\left[\rho_{1}\left(\mathbf{1} + \mathbf{e}^{\frac{-\mathbf{T}}{\lambda}}\right)\right]\left[\rho_{1}\left(\mathbf{1} + \mathbf{e}^{\frac{-\mathbf{t}}{\lambda}}\right)\right]$$

Randall-Sundrum type force

$$\mathbf{F}_{\mathsf{RS}}(\mathbf{z}) = 2\pi^2 \mathbf{r}^2 \mathbf{Gl}_{\mathsf{s}}^2.\rho_1 \ln \left[\frac{\mathbf{z} + \mathbf{T} + \mathbf{t}}{\mathbf{z} + \mathbf{T}}\right].\rho_2 \ln \left[\frac{\mathbf{z} + \mathbf{t}}{\mathbf{z}}\right]$$

# Expected signal

Expected displacement of the mirror for

2  $\mu$ m modulation at 200 Hz

Displacement of the mirror due to

Ref: G. Rajalakshmi, C. S. Unnikrishnan, Class. Quant. Grav., 27, 215007 (2010), arXiv:1006.2228[gr-gc]

- The Casimir force at separations of 10 100μm can be studying with an unprecedented accuracy.
- Finite temperature effects can be detected from the force law as a function of separation and by making measurement at various temperatures between room temperature of about 25°C and 100°C.
- Improved limits can be placed on the parameters of inverse square law violating interactions in the  $10\mu$ m to  $100\mu$ m range from measurement of forces of order  $1 \times 10^{-11}$ N with a sensitivity of better than 1%.
- An experiment to directly look for deviations of inverse square law of gravity in the 10μm to 100μm can be performed.

• The 3m prototype gravity wave detector being set up at TIFR with a sensitivity  $< 10^{-17} m/\sqrt{Hz}$  (in a time scale of about 3 years) can also be used for studying short range interactions

#### Short Range Gravity

- Introduction
- Casimir Force
- Measure short range force with GW Interferometers
- Summary

#### Vacuum Polarisation

- Introduction
- The Q & A Experiment
- Summary

< • • • • • •

- QED predicts that photons are scattered by static electric / magnetic fields
- The virtual photon pairs of the quantum vacuum are also polarized by magnetic fields
- Light propagating thorough magnetic field in vacuum exhibits birefringence.
- In a dipolar field B the QED vacuum becomes a uniaxial birefringent medium with a difference between the refractive indexes

$$\Delta n = \mid n_{\parallel} - n_{\perp} \mid \approx \left(4.10^{-24} \text{Tesla}^{-2}\right) B_0^2 \sin(2\theta)$$

# The Q & A Experiment

- A proto-type GWI with Fabry-Perot cavity at National Tsinhua Univ, Taiwan.
- Modified to work as ellipsometer to detect vacuum birefringence
- Can also detect low mass pseudo-scaler or scaler particles that interact with photons like 'Axions'

#### Measurement of Cotton-Mutton Effect:

Birefringence shown by medium in the presence of transverse magnetic field.

Gas	Normalized Cotton-Mouton birefringence <sup>62</sup>
	$\Delta n_u$ at $P = 1$ atm and $B = 1$ T
$N_2$	$(-2.02 \pm 0.16^{\$} \pm 0.08^{\P}) \times 10^{-13}$
$O_2$	$(-1.79 \pm 0.34^{\$} \pm 0.08^{\P}) \times 10^{-12}$
$CO_2$	$(-4.22 \pm 0.27^{\$} \pm 0.16^{\P}) \times 10^{-13}$
Ar	$(4.31 \pm 0.34^{\$} \pm 0.17^{\P}) \times 10^{-15}$
Kr	$(8.28 \pm 1.26^{\$} \pm 0.32^{\P}) \times 10^{-15}$

Ref: Mei et. al., Modern Physics Letters A, 25, 983 (2010), arXiv:1001.4325v2[physics.ins-det]

Image: 0

- The high finesse of the Fabry-Perot cavity in the proto-type GWI has been effectively used to build a high precision ellipsometer.
- The experiment studies several fundamental issues in physics : vacuum polarisation, dark matter candidates, Cotton-Mouton effect

- The high sensitivity of proto-type GWI can be effectively used to measure quantities in physics that are at the edge of detectability with current experimental techniques
- The 3m proto-type being built at TIFR would have the sensitivity to required such measurments.
